

LIME APPLICATION

APPLYING LIME IN A COFFEE PLANTATION

- Lime is a natural product that is very high in calcium which is very important in the soil. If calcium levels are low, then other nutrients are not available to the plant. **So adding lime increases the availability of the nutrients already in the soil to your coffee trees**
- Plants need calcium just like humans
- Lime is applied in a dry season of June to September.
- After applying lime, cover it with mulching
